

**Amendments to the Claims:**

This listing of claims replaces all prior versions, and listings, of claims in this application.

**Listing of Claims:**

1. (Currently Amended) A method for routing a message from a first mobile station to a second mobile station, comprising:

receiving a routing request from a third party for routing a message from the first mobile station to the second mobile station, the routing request being received by an intermediary, wherein the intermediary operates neither a physical home location register (HLR) nor a physical mobile switching center (MSC);

determining to which carrier the second mobile station subscribes;

dynamically creating an artificial International Mobile Subscriber Identity (IMSI) value based, at least in part, on the carrier to which the second mobile station subscribes, wherein the artificial IMSI value is not an IMSI value assigned to the second mobile station; and

returning a routing response from the intermediary to the third party for routing the message from the first mobile station to the second mobile station, the routing response including the artificial IMSI value, such that the intermediary is considered, from the point of view of the third party, a mobile switching center,

wherein the steps of receiving and returning employ SS7.

2. (Original) The method according to claim 1, wherein the mobile switching center is a virtual mobile switching center.

3. (Original) The method according to claim 1, wherein determining to which carrier the second mobile subscribes includes performing a lookup of the second mobile station against a

database including a plurality of mobile stations associated with a plurality of carriers so that the intermediary functions as a virtual home location register.

4. (Original) The method according to claim 1, wherein the second mobile station is a domestic mobile station, and the carrier to which the second mobile station subscribes and the intermediary are in geographic proximity.

5. (Original) The method according to claim 4, wherein the first mobile station is an international mobile station and a carrier associated with the first mobile station is on a Global System for Mobile Communication (GSM) network.

6. Cancelled

7. (Currently Amended) A method for routing a Global System for Mobile Communication (GSM) Mobile Application Part (MAP) Send Routing Info for Short Message (SRI for SM) message from a third party in connection with sending a message from a first mobile station on a GSM network to a second mobile station, comprising:

receiving a routing request from the third party for routing a message from the first mobile station to the second mobile station, the routing request being received by an intermediary via a SS7 network;

determining to which carrier the second mobile station subscribes;

dynamically creating an artificial International Mobile Subscriber Identify (IMSI) value based, at least in part, on the carrier to which the second mobile station subscribes, wherein the artificial IMSI value is not an IMSI value assigned to the second mobile station; and

returning a routing response from the intermediary to the third party for routing the message from the first mobile station to the second mobile station, the routing response including the artificial IMSI value, such that the intermediary is considered, from the point of view of the third party, as a mobile switching center.

8. (Original) The method according to claim 7, wherein the mobile switching center is a virtual mobile switching center.

9. (Original) The method according to claim 7, wherein determining to which carrier the second mobile subscribes includes performing a lookup of the second mobile station against a database including a plurality of mobile stations associated with a plurality of carriers, whereby the intermediary functions as a virtual home location register.

10. (Original) The method according to claim 7, wherein the second mobile station is a domestic mobile station and the carrier to which the second mobile station subscribes and the intermediary are in geographic proximity.

11. (Currently Amended) An intermediary comprising:  
a virtual network device configured to receive, via SS7, routing requests from third parties for routing a message from one mobile station to another mobile station and to return routing responses to the third parties; and  
a gateway interface device including a database storing a plurality of mobile station identifiers associated with a plurality of carriers, the gateway interface device being configured to perform a lookup to determine to which carrier the ~~second~~ another mobile station subscribes when provided a specific mobile station identifier and to return the carrier associated with the specific mobile station identifier, the gateway interface device being configured to create an artificial International Mobile Subscriber Identity (IMSI) value based, at least in part, on the associated carrier and to provide to the virtual network device the artificial IMSI value such that the intermediary appears, from the point of view of third parties, as a mobile switching center, wherein the artificial IMSI value is not an IMSI value assigned to the another mobile station, and

wherein the virtual network device and the gateway interface device communicate such that, from the point of view of third parties, the intermediary appears to operate a HLR and a MSC.

12. (Previously Presented) The intermediary according to claim 11, wherein the intermediary periodically uploads information including mobile station identifiers of carriers supported by the intermediary to the third parties.

13. (Previously Presented) The method of claim 1, wherein the artificial International Mobile Subscriber Identify (IMSI) value comprises a mobile country code (MCC), a mobile network code (MNC), an internal receiver ID associated with an intermediary component that processed an SRI for SM message, and an index number assigned by the intermediary.

14. (Previously Presented) The method of claim 7, wherein the artificial International Mobile Subscriber Identify (IMSI) value comprises a mobile country code (MCC), a mobile network code (MNC), an internal receiver ID associated with an intermediary component that processed an SRI for SM message, and an index number assigned by the intermediary.

15. (Previously Presented) The intermediary of claim 11, wherein the artificial International Mobile Subscriber Identify (IMSI) value comprises a mobile country code (MCC), a mobile network code (MNC), an internal receiver ID associated with an intermediary component that processed an SRI for SM message, and an index number assigned by the intermediary.
